

HTTP Connections

There are a limited number of HTTP endpoints that can be used for some specific purposes as detailed below.

These are intended for mechanical purposes and are not generally considered 'safe to use' and could be subject to change without a deprecation notice or an API version change. Use at your own risk!

Public

GET /ident

This will trigger this ident feature, making the GUI and buttons flash on a unit.

Authenticated

To access these endpoints the user must be authenticated and have a valid HTTP only session cookie.

GET /flows

This returns a JSON object of all configured flows.

GET /downloadLogs

This returns a .zip file of ALL logs on the unit/server.

GET /licenseMake

This will create a license if the required parameters are populated with valid credentials. To gain access to this endpoint please contact partners@signal.tv to discuss a commercial agreement to fit your workflow.

POST /licenseUpload

This can be used to upload a license file to apply to the unit.
